

Assignment 2: Find Data Sources for your AI Agents

Goal

For 2 domains/problems out of the 3 you've submitted, identify the data sources that will serve as the context store for your AI agent.

Instructions

Identify data sources for each of your domains/problems. These may include:

- **RAG-suitable sources**, and
- **regular data sources** the agent can query directly.

You may use one or multiple data sources per problem.

Each domain must include **at least one RAG-suitable source**.

The **total data size per problem/domain** (combined across all sources) can't exceed **50MB**.

Submission Format

Add the relevant data-source details to 2 out of 3 of your **Assignment 1 submission**, at the end of each domain/pain-point section, and **resubmit the form**.

Group Number/Name:

Student Names:

Student Emails:

- **Domain Name:** The selected domain (from the shared list).
- **Short description of the pain point:** Describe a real, specific problem faced by users in this domain. Focus on *what's difficult, inefficient, or missing*.
- **Target audience:** Define who exactly experiences this problem (e.g., independent nutritionists, startup recruiters, etc.)
- **Evidence / Discovery:** Describe how you conducted your research, including any AI tools you used, and then complete the table below with the **evidence** (quotes, posts, or discussions) that led you to identify each pain point.

#	Evidence	Source, links
	Present quotes found online that helped identify the pain point. I.e: I spend hours keeping track of edits from three clients and always miss something.	

Data Sources

**Note, If you submit more than one data source per domain, duplicate this section.*

- **Data source name:** A clear, descriptive name for the data source.
- **Data source type:** RAG / Postgres / Other.
- **Data source link:** Provide the online link(s) to the data source.
- **Data source size (MB/GB):** State the approximate total size.
- **Data source description:** Describe the data source in detail and explain why it is relevant and suitable for solving the problem.
- **Data source table example:** Include the column headers and **three sample rows** (one table per data source).

Headers[]
Example row 1 []
Example row 2 []
Example row 3 []

What Makes a Good Submission

A good submission will:

1. **Be clear and focused:** Each data source should be described briefly and professionally.
2. **Be relevant:** Choose data sources that directly support the problem you are solving, and explain the connection.

Deliverable

Upload your group document by **14.6.2026** (End of Day) via Moodle.

Good luck!
